

# RaceDay Database Entity-Relationship Diagram (ERD)

PROG6212 Portfolio of Evidence — Full data model for the RaceDay event management system. The schema below is designed so the entities, attributes, keys and cardinalities can be used directly as the basis for the Section C SQL script.

**Relationship rules:** An Event Organiser creates many Events, each Event belongs to one Organiser. Each Event contains many Categories and has one Route. Participants can register for many Events through Registration. Each Registration belongs to one Event, one Category and one Participant. A Registration may have zero or one Result. An Event can have many Weather Forecast records so forecast information can be updated over time.

**SQL consistency note:** The foreign-key columns shown in the ERD are the exact relationship columns to be implemented in Section C: EVENT.organiser\_id, CATEGORY.event\_id, REGISTRATION.event\_id, REGISTRATION.category\_id, REGISTRATION.participant\_id, RESULT.registration\_id, ROUTE.event\_id, and WEATHER\_FORECAST.event\_id.
